

APPROVED PACKAGE INSERT

SCHEDULING STATUS: S6

PROPRIETARY NAMES (AND DOSAGE FORMS)

RITALIN® 10 Tablets

RITALIN® LA 10 Capsules

RITALIN® LA 20 Capsules

RITALIN® LA 30 Capsules

RITALIN® LA 40 Capsules

COMPOSITION

RITALIN 10 tablets containing 10 mg methylphenidate hydrochloride.

RITALIN LA Modified-release capsules, contain 10 mg, 20 mg, 30 mg and 40 mg methylphenidate hydrochloride.

Other inactives:

RITALIN tablet (10 mg): calcium phosphate, lactose, wheat starch, gelatine, magnesium stearate and talc.

Contains sugar: Lactose.

RITALIN LA capsules (10 mg, 20 mg, 30 mg and 40 mg): ammonio methacrylate copolymer, black iron oxide (E 172) (10 mg and 40 mg capsules only), gelatine, methacrylic acid copolymer, macrogol, red iron oxide (E 172) (10 mg and 40 mg capsules only), sugar spheres, talc, titanium

dioxide (E 171), triethyl citrate and yellow iron oxide (E 172) (10 mg, 30 mg and 40 mg capsules only).

Contains sugar: Sucrose.

PHARMACOLOGICAL CLASSIFICATION

A 1.2 Psychoanaleptics (antidepressants)

PHARMACOLOGICAL ACTION

Pharmacodynamic properties

Methylphenidate is a racemate, consisting of a 1:1 mixture of d-methylphenidate and l-methylphenidate.

Methylphenidate is a central nervous system stimulant with more prominent effects on mental than on motor activities. Its mode of action in man is not completely understood, but its stimulant effects are thought to be due to inhibition of dopamine reuptake in the striatum, without triggering the release of dopamine. The mechanism by which methylphenidate exerts its mental and behavioural effects in children is not clearly established, nor is there conclusive evidence showing how these effects relate to the condition of the central nervous system.

The effect of treatment with 40 mg dexmethylphenidate hydrochloride, the pharmacologically active d-enantiomer of methylphenidate, on QT/QTc interval was evaluated in a study in 75 healthy adult volunteers. The maximum mean prolongation of QTcF intervals was < 5 millisecond (ms), and the upper limit of the 90 % confidence interval was below 10 ms for all time matched comparisons versus placebo. This was below the threshold of clinical concern and no exposure response relationship was evident.

Pharmacokinetic properties:***Absorption:*****Methylphenidate 10:**

The active substance, methylphenidate hydrochloride, is rapidly and almost completely absorbed.

Owing to extensive first-pass metabolism, the absolute bioavailability was 22 ± 8 % for the d-enantiomer and 5 ± 3 % for the l-enantiomer.

Ingestion with food has no relevant effect on absorption. Peak plasma concentrations of approximately 40 nmol/litre (11 ng/mL) are attained, on average 1 to 2 hours after administration. The peak plasma concentrations, however, vary markedly from one person to another. The area under the plasma concentration curve (AUC), as well as the peak plasma concentration (C_{max}), is proportional to the size of the dose administered.

Methylphenidate LA 10, methylphenidate LA 20, methylphenidate LA 30 and methylphenidate LA 40 capsules:

Following oral administration of methylphenidate hydrochloride (modified-release capsules) to children diagnosed with ADHD and adults, methylphenidate plasma concentration-time profiles show a bi-modal profile (i.e. two distinct peaks approximately four hours apart). The fluctuations between peak and trough plasma methylphenidate concentrations are smaller for methylphenidate LA given once a day compared to methylphenidate tablets given twice a day.

Methylphenidate hydrochloride may be administered with or without food. There were no differences in the bioavailability of methylphenidate LA when administered with either a high fat breakfast or applesauce, compared to administration in the fasting condition. There is no evidence of dose dumping in the presence or absence of food.

For patients unable to swallow the capsule, the contents may be sprinkled on soft food and administered (see **DOSAGE AND DIRECTIONS FOR USE**).

Distribution:

In the blood, methylphenidate and its metabolites are distributed in the plasma (57 %) and in the erythrocytes (43 %). Methylphenidate and its metabolites have a low plasma protein-binding (10 to 33 %).

The apparent distribution volume has been calculated as 13,1 L/kg after an oral dose; the volume of distribution after intravenous dose (V_{ss}) is 2,23 L/kg for the racemate in healthy adult volunteers.

The volume of distribution was $2,65 \pm 1,11$ L/kg for dextromethylphenidate (d-MPH) and $1,80 \pm 0,91$ L/kg for levomethylphenidate (l-MPH).

Methylphenidate is excreted in breast milk.

Elimination:

Methylphenidate is eliminated from the plasma with a mean half-life of 2 hours, and the systemic clearance is $0,40 \pm 0,12$ L/h/kg for d-MPH and $0,73 \pm 0,28$ L/h/kg for l-MPH. After oral administration 78 to 97 % of the dose is excreted in the urine and 1 to 3 % in the faeces in the form of metabolites within 48 to 96 hours. Unchanged methylphenidate appears in the urine only in small quantities (< 1 %). The bulk of the dose is excreted in the urine as α -phenyl-2-piperidine acetic acid (PPAA, 60 to 86 %).

Biotransformation:

Peak plasma concentrations of PPAA (ritalinic acid) are attained approximately 2 hours after administration of methylphenidate and are 30 to 50 times higher than those of the unchanged substance. The half-life of PPAA is roughly twice as long as that of methylphenidate, and the mean systemic clearance is 0,17 L/h/kg.

Characteristics in patients:

There are no apparent differences in the pharmacokinetic behaviour of methylphenidate in hyperactive children and healthy adult volunteers.

Renal excretion of the unchanged methylphenidate is hardly diminished at all in the presence of impaired renal function; however, renal excretion of PPAA is reduced.

INDICATIONS

RITALIN 10 mg tablets

Attention deficit hyperactivity disorder (ADHD) in children aged 6 years or older.

Narcolepsy in adults.

RITALIN LA

Attention deficit hyperactivity disorder (ADHD) in children aged 6 years or older, and in adults with ADHD onset in childhood.

The diagnosis should be made according to current DSM criteria or the guidance from International Classification of Diseases (ICD).

CONTRAINDICATIONS

Anxiety, tension, agitation, a family history or diagnosis of Tourette's syndrome, hyperthyroidism, glaucoma, phaeochromocytoma.

Pre-existing cardiovascular disorders, including hypertension, angina, arterial occlusive disease; heart failure, haemodynamically significant congenital heart disease, cardiomyopathies, myocardial infarction, potentially life-threatening dysrhythmias, channelopathies (disorders caused by the dysfunction of ion channels) and QT prolongation either congenital, familial or caused by medication (see **WARNINGS AND SPECIAL PRECAUTIONS**).

During treatment with monoamine oxidase (MAO) inhibitors, or within a minimum of 2 weeks of discontinuing those medicines, due to risk of hypertensive crisis (see **INTERACTIONS**).

Known hypersensitivity to methylphenidate or to any of the excipients of RITALIN.

Pregnancy and lactation (see **PREGNANCY AND LACTATION**).

WARNINGS AND SPECIAL PRECAUTIONS

General:

RITALIN should not be used for the prevention or treatment of normal fatigue states.

Treatment with RITALIN is not indicated in all cases of Attention-deficit/Hyperactivity disorder, and should be considered only after detailed history-taking and evaluation. The decision to prescribe RITALIN should depend on an assessment of the severity of symptoms and, in paediatric patients, their appropriateness to the child's age and not simply on the presence of one or more abnormal behavioural characteristics.

RITALIN should not be used for the treatment of attention-deficit or hyperactivity secondary to amenable causes, including acute stress reactions.

Chronic abuse of RITALIN can lead to marked tolerance and psychological dependence with varying degrees of abnormal behaviour. Frank psychotic episodes may occur. Abuse of RITALIN may prove a problem in predisposed patients e.g. in emotionally unstable individuals or those with a history of drug dependence or alcoholism.

RITALIN should therefore be used only under medical supervision. Clinical data indicate that children given RITALIN are not more likely to abuse drugs than adolescents or adults.

Cardiovascular:

Pre-existing Structural Cardiac Abnormalities or Other Serious Heart Problems:

Sudden death has been reported in association with the use of RITALIN at usual doses in patients with pre-existing structural cardiac abnormalities or other serious heart problems. A causal relationship with RITALIN has not been established since some of these conditions alone may carry an increased risk of sudden death. RITALIN generally should not be used in patients with known structural cardiac abnormalities or other serious cardiac disorders that may increase the risk of sudden death due to its sympathomimetic effects. Before initiating RITALIN treatment, patients should be assessed for pre-existing cardiovascular disorders such as a congenital long QT syndrome, or a family history of sudden death and ventricular dysrhythmia (see **DOSAGE AND DIRECTIONS FOR USE**).

Misuse and Cardiovascular Events:

Misuse of RITALIN, may be associated with sudden death and other serious cardiovascular adverse events.

Cardiovascular conditions:

RITALIN is contraindicated in patients with hypertension. RITALIN increases heart rate and systolic and diastolic blood pressure. Therefore, caution is indicated in treating patients whose underlying medical conditions might be compromised by increases in blood pressure or heart rate, e.g. those with pre-existing hypertension and severe cardiovascular disorders (see **CONTRAINDICATIONS**).

Blood pressure should be monitored at appropriate intervals in all patients taking RITALIN. Patients who develop symptoms suggestive of cardiac disease during RITALIN treatment should undergo a prompt cardiac evaluation.

Cerebrovascular:

Cerebrovascular conditions: Patients with pre-existing central nervous system (CNS) abnormalities, e.g. cerebral aneurysm and/or other vascular abnormalities such as vasculitis or pre-existing stroke should not be treated with RITALIN.

Patients with additional risk factors (history of cardiovascular disease, concomitant medications that elevate blood pressure) should be assessed regularly for neurological/psychiatric signs and symptoms after initiating treatment with RITALIN (see above, paragraph on **Cardiovascular Conditions** and **INTERACTIONS**).

Psychiatric:

Co-morbidity of psychiatric disorders in ADHD is common and should be taken into account when prescribing RITALIN. Prior to initiating treatment with RITALIN, patients should be assessed for pre-existing psychiatric disorders and a family history of psychiatric disorders (see **DOSAGE AND DIRECTIONS FOR USE**). Treatment of ADHD with RITALIN should not be initiated in patients with acute psychosis, acute mania or acute suicidality. These acute conditions should be treated and controlled before ADHD treatment is considered.

In the case of emergent psychiatric symptoms or exacerbation of pre-existing psychiatric symptoms, RITALIN should not be given to patients unless the benefit outweighs the potential risk.

Psychotic symptoms: Psychotic symptoms, including visual and tactile hallucinations or mania have been reported in patients administered recommended therapeutic doses of RITALIN (see **SIDE-EFFECTS**). Medical practitioners should consider treatment discontinuation.

Aggressive behaviour: Emergent aggressive behaviour or an exacerbation of baseline aggressive behaviour has been reported during RITALIN therapy. However, patients with ADHD may experience aggression as part of their medical condition. Therefore a causal association with treatment may be difficult to assess. Medical practitioners should evaluate the need for adjustment of treatment regimen in patients experiencing these behavioural changes, bearing in mind that upwards or downwards titration may be appropriate. Treatment interruption can be considered.

Suicidal tendency: Patients with emergent suicidal ideation and behaviour during treatment for ADHD should be evaluated immediately by their medical practitioner. The medical practitioner should initiate appropriate treatment of the underlying psychiatric condition and consider a possible change in the ADHD treatment regimen.

Tics: Ritalin is associated with the onset or exacerbation of motor and verbal tics. Worsening of Tourette's syndrome has also been reported (see **SIDE-EFFECTS**). Family history should be assessed and clinical evaluation for tics or Tourette's syndrome in patients should precede use of RITALIN for ADHD treatment. RITALIN is contraindicated in case of diagnosis or family history of Tourette's syndrome (see **CONTRAINDICATIONS**). Patients should be regularly monitored for the emergence or worsening of tics during treatment with RITALIN.

Serotonin syndrome: Serotonin syndrome has been reported following co-administration of methylphenidate with serotonergic medicines such as selective serotonin reuptake inhibitors (SSRIs) and serotonin-norepinephrine reuptake inhibitors (SNRIs). The concomitant use of RITALIN and serotonergic medicines is not recommended as this may lead to the development of serotonin syndrome. The symptoms of serotonin syndrome may include mental status changes (e.g. agitation, hallucinations, delirium, and coma), autonomic instability (e.g. tachycardia, labile blood pressure, dizziness, diaphoresis, flushing, hyperthermia), neuromuscular symptoms (e.g. tremor, rigidity, myoclonus, hyperreflexia, incoordination), seizures, and/or gastrointestinal symptoms (e.g. nausea, vomiting, diarrhea). Prompt recognition of these symptoms is important so that treatment with RITALIN and serotonergic medicines can be immediately discontinued and appropriate treatment instituted (see **INTERACTIONS**).

Priapism: Prolonged and painful erections, sometimes requiring surgical intervention, have been reported with methylphenidate products in both paediatric and adult patients. Priapism generally developed after some time on the medicine, often subsequent to an increase in dose. Priapism has also been reported during a period of medicine withdrawal (drug holidays or during discontinuation). Patients who develop abnormally sustained or frequent and painful erections should seek immediate medical attention.

Growth retardation:

Reduced weight gain and slight growth retardation have been reported with the long-term use of RITALIN (see **SIDE-EFFECTS**). Growth and weight should be monitored during treatment with RITALIN, and patients who are not growing or gaining height or weight as expected or are losing weight may need to have their treatment interrupted and adjusted.

Haematological effects:

The long-term safety and efficacy profiles of RITALIN are not fully known. Patients requiring long-term therapy should therefore be carefully monitored and complete and differential blood counts and a platelet count performed periodically. In the event of haematological disorders appropriate medical intervention should be considered (see **SIDE-EFFECTS**).

Seizures:

RITALIN should be used with caution in patients with epilepsy as clinical experience has shown that it can cause an increase in seizure frequency. If seizure frequency increases, RITALIN should be discontinued.

Drug abuse and dependence:

Chronic abuse of RITALIN can lead to marked tolerance and psychological dependence with varying degrees of abnormal behaviour. Frank psychotic episodes may occur, especially with parenteral abuse.

Caution is called for in emotionally unstable patients, such as those with a history of drug dependence or alcoholism, because they may increase the dosage on their own initiative.

Withdrawal:

Careful supervision is required during RITALIN withdrawal, since this may unmask depression as well as the effects of chronic overactivity. Some patients may require long-term follow-up.

Paediatric patients under 6 years of age:

RITALIN is not indicated in children less than six years of age.

Treatment with RITALIN is not indicated in all cases of Attention-Deficit/Hyperactivity disorder and should be considered only after detailed history-taking and evaluation. The decision to prescribe RITALIN should depend on the medical practitioner assessment of the chronicity and severity of the child's symptoms and, their appropriateness to the child's age. Prescription should not depend solely on the presence of one or more abnormal behavioural characteristics. Where these symptoms are associated with acute stress reactions, treatment with RITALIN is not indicated.

Driving and using machines:

RITALIN may cause dizziness, drowsiness, blurred vision, hallucinations or other CNS side-effects (see **SIDE-EFFECTS**). Patients experiencing such side-effects should refrain from driving, operating machines or engaging in other potentially hazardous activities.

Lactose intolerance:

RITALIN 10 tablets contain lactose. Patients with rare hereditary problems of lactose intolerance e.g. galactosaemia or severe lactase deficiency should not use RITALIN 10 tablets.

RITALIN LA capsules contains sucrose. Patients with rare hereditary conditions such as fructose intolerance, glucose-galactose malabsorption or sucrase-isomaltase insufficiency should not take RITALIN LA capsules.

RITALIN 10 (containing lactose) and RITALIN LA (containing sucrose) may have an effect on the glycaemic control of patients with diabetes mellitus.

INTERACTIONS

Pharmacodynamic interactions:

Anti-hypertensive medicines

RITALIN may decrease the effectiveness of medicines used to treat hypertension.

Use with medicines that elevate blood pressure

RITALIN should be used with caution in patients being treated with medicines that elevate blood pressure (see paragraph on **Cerebrovascular Conditions** under **WARNINGS AND SPECIAL PRECAUTIONS**). Because of possible hypertensive crisis, RITALIN is contraindicated in patients being treated (currently or within the preceding 2 weeks) with MAO-inhibitors (see **CONTRAINDICATIONS**).

Use with alcohol

Alcohol may exacerbate the central nervous system adverse reactions of RITALIN. It is advisable for patients to abstain from alcohol during treatment.

Use with dopaminergic medicines

As an inhibitor of dopamine reuptake, RITALIN may be associated with pharmacodynamic interactions when coadministered with direct and indirect dopamine agonists (including DOPA and tricyclic antidepressants) as well as dopamine antagonists (antipsychotics, e.g. haloperidol). The coadministration of RITALIN with antipsychotics is not recommended because of the counteracting mechanism of action.

Use with anaesthetics

There is a risk of sudden blood pressure and heart rate increase during surgery. If surgery is planned, RITALIN should not be taken on the day of surgery.

Use with centrally acting alpha-2 agonists (e.g. clonidine or dexmedetomidine)

Serious adverse events including sudden death may occur in concomitant use with clonidine or dexmedetomidine, although no causality for the combination has been established.

Use with serotonergic drugs

The concomitant use of RITALIN and serotonergic drugs is not recommended as this may lead to the development of serotonin syndrome (see **WARNINGS AND SPECIAL PRECAUTIONS**).

Methylphenidate has been shown to increase extracellular serotonin and norepinephrine and appears to have weak potency in binding serotonin transporter.

Pharmacokinetic interactions:

RITALIN is not metabolised by cytochrome P450 to a clinically relevant extent. Inducers or inhibitors of cytochrome P450 are not expected to have any relevant impact on RITALIN pharmacokinetics.

Conversely, the d- and l- enantiomers of methylphenidate in RITALIN did not relevantly inhibit cytochrome P450 1A2, 2C8, 2C9, 2C19, 2D6, 2E1 or 3A.

RITALIN coadministration did not increase plasma concentrations of the CYP2D6 substrate desipramine.

Case reports suggested a potential interaction of RITALIN with warfarin, some anticonvulsants (e.g. phenobarbital, phenytoin, primidone) and tricyclic antidepressants but pharmacokinetic interactions were not confirmed when explored at higher sample sizes. The dosage of these medicines might have to be reduced.

Other specific medicine-medicine interaction studies with RITALIN have not been performed *in vivo*.

Medicine/Laboratory test:

RITALIN may induce false positive laboratory tests for amphetamines, particularly with immunoassays screen test.

PREGNANCY AND LACTATION

RITALIN is contraindicated in pregnancy and lactation as safety has not been demonstrated (see **CONTRAINDICATIONS**).

Mothers on RITALIN should not breastfeed their infants.

DOSAGE AND DIRECTIONS FOR USE

Dosage:

The dosage of RITALIN should be individualised according to the patient's clinical needs and responses.

RITALIN should be started at a low dose, with increments at weekly intervals.

Daily doses above 60 mg are not recommended for the treatment of narcolepsy in adults, or for the treatment of ADHD in children. Effective doses in adults may vary, and range from 40 – 80 mg per day.

Daily doses above 80 mg are not recommended for the treatment of ADHD in adults (RITALIN LA only).

If improvement is not observed after appropriate dosage adjustment over a one-month period, RITALIN should be discontinued.

If paradoxical aggravation of symptoms or other adverse effects occur, RITALIN should be discontinued.

Pre-treatment screening

Before initiating RITALIN treatment, patients should be assessed for pre-existing cardiovascular and psychiatric disorders and a family history of sudden death, ventricular dysrhythmia and psychiatric disorders (see **CONTRAINDICATIONS** and **WARNINGS AND SPECIAL PRECAUTIONS**).

NARCOLEPSY:

Only the RITALIN 10 mg formulation is approved in the treatment of narcolepsy in adults.

The average dosage is 20 to 30 mg daily, given in 2 to 3 divided doses. Some patients may require 40 to 60 mg daily. In others, 10 to 15 mg daily will be adequate. Patients who are unable to sleep if medication is taken late in the day should take the last dose before 6 p.m.

A total daily dose of 60 mg should not be exceeded.

Periodic assessment of the treatment in ADHD

Medicine treatment should not and need not be indefinite.

RITALIN should be periodically discontinued to assess the patient's condition. Improvement may be sustained when the medicine is either temporarily or permanently discontinued.

When used in children with ADHD, RITALIN can usually be discontinued after puberty.

ADHD:

Children and adolescents (6 years and over):

Tablets:

Start with 5 mg once or twice daily (before breakfast and lunch) with gradual increments of 5 to 10 mg weekly. The total daily dose should be administered in divided doses.

RITALIN LA capsules:

RITALIN LA (methylphenidate hydrochloride modified-release capsules) is for oral administration once daily in the morning. The recommended starting dose of RITALIN LA is 20 mg. When in the judgement of the clinician a lower initial dose is appropriate, patients may begin treatment with RITALIN LA 10.

Daily dosage above 60 mg is not recommended.

Adults:

Only the RITALIN LA formulation should be used for the treatment of ADHD in adults.

RITALIN LA is administered once daily in the morning.

Patients new to methylphenidate: The recommended starting dose of RITALIN LA in patients who are not currently taking methylphenidate is 20 mg once daily.

Patients currently using methylphenidate: Treatment may be continued with the same daily dose. If the patient was previously treated with an immediate release formulation, a conversion to an appropriate recommended dose of RITALIN LA should be made (see below subsection “*Switching patients to RITALIN LA*”).

A maximum daily dose of 80 mg should not be exceeded.

Switching patients to RITALIN LA:

The recommended dose of RITALIN LA should be equal to the total daily dose of the immediate release formulation not exceeding a total of 60 mg in children and 80 mg in adults. An example in patients being switched from the immediate-released formulation is provided below.

Recommended daily dose when switching patients to RITALIN LA

<i>Previous RITALIN dose</i>	<i>Recommended RITALIN LA dose</i>
5 mg RITALIN twice daily	10 mg once daily
10 mg RITALIN twice daily	20 mg once daily
15 mg RITALIN twice daily	30 mg once daily
20 mg RITALIN twice daily	40 mg once daily

For other RITALIN regimens, clinical judgment should be used when selecting the starting dose.

RITALIN LA dosage may be adjusted at weekly intervals in 10 mg increments for children and in 20 mg increments for adults.

Method of administration:

General recommendations

RITALIN 10 mg tablets can be taken with or without food.

RITALIN LA capsules may be administered with or without food. They may be swallowed as whole capsules or alternatively may be administered by sprinkling the contents over a small amount of food (see specific instructions below). The granules must be swallowed whole and not chewed or crushed.

RITALIN LA capsules and/or their contents should not be crushed or chewed.

RITALIN LA administration by sprinkling capsule contents on food:

The capsules may be carefully opened and the beads sprinkled over soft food.

The food should not be warm because this could affect the modified-release properties of this formulation.

The mixture of medicine and food should be consumed immediately in its entirety. This soft food mixture **should not be chewed** but swallowed only.

The medicine and food mixture should not be stored for future use.

RITALIN LA, administered as a single dose, provides comparable overall exposure (AUC) of methylphenidate compared to the same total dose of RITALIN administered twice daily.

Special populations

Renal impairment

No studies have been performed in renally impaired patients.

Hepatic impairment

No studies have been performed in hepatically impaired patients.

Geriatric patients

No studies have been performed in patients over 60 years of age.

SIDE-EFFECTS

Nervousness and insomnia are very common adverse reactions. These usually occur at the beginning of RITALIN treatment and may be reduced by decreasing the dose and omitting the medicine in the afternoon or evening.

Decreased appetite is very common.

Abdominal pain, nausea and vomiting are common to very common.

Reports of neuroleptic malignant syndrome (NMS) have been received. In most of these reports patients were also receiving other medications. It is uncertain what role RITALIN played in these cases.

Tabulated summary of adverse drug reactions

Adverse drug reactions are listed by MedDRA system organ class. Within each system organ class, the adverse drug reactions are ranked by frequency, with the most frequent reactions first. Within each frequency grouping, adverse drug reactions are presented in order of decreasing seriousness.

In addition, the corresponding frequency category for each adverse drug reaction is based on the following convention (CIOMS III): very common $\geq 1/10$; common $\geq 1/100$ to $< 1/10$; uncommon $\geq 1/1000$ to $< 1/100$; rare $\geq 1/10000$ to $< 1/1000$; very rare $< 1/10000$.

Table: Adverse reactions reported with RITALIN use

Infections and infestations:

Very common: Nasopharyngitis*

Blood and the lymphatic system disorders:

Very rare: Leucopenia, thrombocytopenia, anaemia

Immune system disorders:

Very rare: Hypersensitivity reactions

Metabolism and nutrition disorders:

Very Common: Decreased appetite**

Rare: Reduced weight gain during prolonged use in children

Psychiatric disorders:

Very Common: Nervousness, insomnia

Common: Anxiety*, restlessness*, sleep disorder*, agitation*

Very rare: Hyperactivity, psychosis (sometimes with visual and tactile hallucinations), transient depressed mood

Nervous system disorders:

Common: Dyskinesia, tremor*, headache, drowsiness, dizziness

Very rare: Convulsions, choreo-athetoid movements, tics or exacerbation of existing tics and Tourette's syndrome, cerebrovascular disorders including vasculitis, cerebral haemorrhages and cerebrovascular accidents

Skin and subcutaneous tissue disorders:

Common: Rash, pruritus, urticaria, fever, scalp hair loss, hyperhidrosis*

Very rare: Thrombocytopenic purpura, exfoliative dermatitis, erythema multiforme

Musculoskeletal and connective tissue disorders:

Common: Arthralgia

Very rare: Muscle cramps

General disorders and administration site conditions:

Common: Feeling jittery*

Rare: Growth retardation during prolonged use in children

Investigations:

Common: Weight decreased*

* ADRs reported from clinical trials performed with RITALIN LA in adult ADHD patients

**The reported frequency of ADRs was based on the frequency observed in the adult ADHD clinical study which was higher than that previously reported for children.

The list below shows reported post-marketing adverse reactions

Blood and lymphatic disorders:

Pancytopenia

Immune system disorders:

Hypersensitivity reactions, such as auricular swelling, including angioedema and anaphylaxis

Psychiatric disorders:

Irritability, aggression, affect lability, abnormal behaviour or thinking, anger, suicidal ideation or attempt (including completed suicide), mood altered, mood swings, hypervigilance, mania,

disorientation, libido disorder, apathy, repetitive behaviours, over-focussing, confusional state, dependence. Cases of abuse and dependence have been described.

Nervous system disorders:

Reversible ischaemic neurological deficit, migraine

Eye disorders:

Diplopia, mydriasis, visual disturbance

Cardiac disorders:

Cardiac arrest, myocardial infarction

Vascular disorders:

Peripheral coldness, Raynaud's phenomenon

Respiratory, thoracic and mediastinal disorders:

Pharyngolaryngeal pain, dyspnoea

Gastrointestinal disorders:

Diarrhoea, constipation

Skin and subcutaneous tissue disorders:

Angioedema, erythema, fixed drug eruption

Musculoskeletal, connective tissue and bone disorders:

Myalgia, muscle twitching

Renal and urinary disorders:

Haematuria

Reproductive system and breast disorders:

Gynaecomastia

General disorders and administration site conditions:

Chest pain, fatigue, sudden cardiac death

Investigations:

Cardiac murmur

Adverse drug reactions from spontaneous reports and literature cases (frequency not known)

The following adverse drug reactions have been derived from post-marketing experience with RITALIN via spontaneous case reports and literature cases. Because these reactions are reported voluntarily from a population of uncertain size, it is not possible to reliably estimate their frequency which is therefore categorized as not known. Adverse drug reactions are listed according to system organ classes in MedDRA. Within each system organ class, ADRs are presented in order of decreasing seriousness.

Reproductive system and breast disorders

Priapism

KNOWN SYMPTOMS OF OVERDOSAGE AND PARTICULARS OF ITS TREATMENT

Signs and symptoms:

Vomiting, agitation, tremors, hyperreflexia, muscle twitching, convulsions (may be followed by coma), euphoria, confusion, hallucinations, delirium, sweating, flushing, headache, hyperpyrexia, tachycardia, palpitation, cardiac dysrhythmias, hypertension, mydriasis, dryness of mucous membranes and rhabdomyolysis.

Treatment:

When treating overdose practitioners should bear in mind that a second release of methylphenidate from RITALIN LA (methylphenidate hydrochloride modified-release capsules) occurs at approximately four hours after administration.

Treatment consists of appropriate supportive measures and symptomatic treatment of life-threatening events e.g. hypertensive crisis, cardiac dysrhythmias, convulsions. For the most current guidance for treatment of symptoms of overdose, the practitioner should consult a certified Poison Control Centre or current toxicological publication.

Supportive measures include protection of the patient against self-injury and against external stimuli that would exacerbate the overstimulation already present. If the overdose is oral and the patient is conscious, administration of activated charcoal is recommended.

Intensive care must be provided to maintain adequate circulation and respiratory exchange; external cooling procedures may be required to reduce hyperpyrexia.

Efficacy of peritoneal dialysis or extracorporeal haemodialysis for overdosage of RITALIN has not been established.

IDENTIFICATION

RITALIN® 10

White, round tablet, flat on both sides, with bevelled edges. Imprinted "CG" on one side, and "A/B" with a score on the other. Diameter approximately 7,0 mm; thickness approximately 2,5 mm.

RITALIN® LA 10:

Size # 2, modified-release hard gelatin capsule with a light brown opaque cap and a white opaque body, imprinted with “NVR” in tan ink on the cap and “R10” in tan ink on the body, containing white to off-white beads that are roughly spherical in shape.

RITALIN® LA 20

Size # 2, modified-release white opaque hard gelatin capsule, imprinted with “NVR” in tan ink on the cap and “R20” in tan ink on the body, containing white to off-white beads that are roughly spherical in shape.

RITALIN® LA 30

Size # 2, modified-release yellow opaque hard gelatin capsule, imprinted with “NVR” in tan ink on the cap and “R30” in tan ink on the body, containing white to off-white beads that are roughly spherical in shape.

RITALIN® LA 40

Size # 1, modified-release light brown opaque hard gelatin capsule, imprinted with “NVR” in tan ink on the cap and “R40” in tan ink on the body, containing white to off-white beads that are roughly spherical in shape.

PRESENTATION

RITALIN® 10 is supplied as tablets of 10 mg in blister packs of 30.

RITALIN® LA is available in white HDPE bottles containing 30 and 100 modified-release capsules.

STORAGE INSTRUCTIONS

RITALIN® 10:

Store at or below 25 °C and protect from moisture.

KEEP OUT OF THE REACH OF CHILDREN.

RITALIN® LA capsules:

Store at or below 25° C. Keep the container tightly closed. Protect from moisture.

KEEP OUT OF THE REACH OF CHILDREN.
